Chesterfield, MO | +1(314)885-3349 | meghashyam1008@gmail.com | [LinkedIn](#)

PROFESSIONAL SUMMARY

- Java Full Stack Developer with 5+ years of experience designing and implementing scalable, high-availability enterprise applications using Java 8/11/17, J2EE, Spring Boot, Spring Cloud, and Microservices Architecture across healthcare, banking, and retail domains.
- Strong background in cloud-native architecture and system design, building secure RESTful APIs and event-driven systems using Apache Kafka, Spring Security, OAuth2, and JWT to support high-volume transactional environments.
- Experienced in performance tuning and database optimization using PostgreSQL and Hibernate, improving application scalability and reducing latency in distributed systems.
- Proficient in developing ReactJS and Angular front-end applications integrated with backend services deployed on AWS and Azure through Docker-based CI/CD pipelines using Jenkins and GitHub Actions.

TECHNICAL SKILLS

Programming Languages: Java (8/11/17), TypeScript, JavaScript (ES6+), SQL

Backend Development: Spring Boot 3.x, Spring MVC, Spring Data JPA, Hibernate, Spring Security, RESTful API Development, Microservices Architecture, API Gateway, Distributed Systems, System Design, Performance Tuning

Frontend Development: ReactJS, Angular 10/12, HTML5, CSS3, Responsive Web Design

Cloud & Containerization: AWS (EC2, RDS), Azure App Services, Docker, Cloud-Native Architecture

Messaging & Streaming: Apache Kafka, Event-Driven Architecture

Databases & Caching: PostgreSQL, MySQL, Oracle, Redis

DevOps & CI/CD: Jenkins, GitHub Actions, Maven, CI/CD Automation

Security: Spring Security, OAuth2, JWT, RBAC, Multi-Factor Authentication

Monitoring & Observability: ELK Stack, Splunk

Methodologies: Agile/Scrum, SOLID Principles, Scalable System Design

PROFESSIONAL EXPERIENCE

Java Full Stack Developer

Sep 2024 - Present

HCA Healthcare | Kansas City, MO

- Led the redesign of patient scheduling and intake workflows into Spring Boot microservices using Spring Cloud Gateway, working with clinical operations teams to reduce appointment processing time by 35% across multiple facilities.
- Built FHIR R4 compliant REST APIs with Spring MVC and secured them through Spring Security using OAuth2 and JWT, enabling reliable EHR and payer integrations while meeting HIPAA data protection requirements.
- Coordinated with billing and pharmacy teams to implement Kafka-based asynchronous communication between core services, increasing peak-hour transaction throughput by 40% and preventing processing backlogs.
- Reworked the Angular 12 patient and provider portal using TypeScript and REST integrations, improving online appointment bookings by 28% and lowering front-desk administrative effort.
- Improved backend performance by tuning PostgreSQL queries, refining Hibernate entity mappings, and introducing Redis caching, cutting API response times by 38% under concurrent clinical workloads.
- Partnered with DevOps engineers to containerize applications using Docker and automate CI/CD pipelines through GitHub Actions and Azure DevOps, reducing deployment errors and ensuring consistent releases across environments.
- Enhanced application security by configuring RBAC and multi-factor authentication in Spring Security, aligning access controls with internal audit standards and reducing unauthorized access risks.
- Collaborated with infrastructure teams to implement centralized logging and monitoring through ELK Stack and Splunk dashboards, shortening incident diagnosis time by 25% and improving overall system reliability.

Full Stack Developer

May 2021 - Aug 2023

PNC Bank | Chicago, IL

- Re-architected the digital loan origination system into Spring Boot microservices using Spring Data JPA and REST APIs, stabilizing high-volume transaction flows and maintaining 99.9% uptime across online banking channels.
- Integrated external fraud detection and credit bureau platforms through OAuth2-secured REST clients, partnering with risk analysts to reduce manual underwriting effort by 22% and speed up approval cycles.
- Built Angular 10 dashboards with TypeScript and reactive forms to support real-time loan tracking and account visibility, increasing customer self-service adoption by 30%.
- Introduced Kafka-based asynchronous settlement and reconciliation processing, improving end-of-day transaction throughput by 35% and reducing processing bottlenecks.
- Strengthened financial data protection by configuring Spring Security with JWT, RBAC, and multi-factor authentication, ensuring alignment with internal audit controls and federal banking regulations.
- Improved PostgreSQL performance by optimizing indexes and refactoring complex Hibernate queries, lowering transaction response latency by 32% during concurrent user activity.
- Containerized backend services using Docker and automated deployments to AWS EC2 and RDS via Jenkins CI/CD pipelines, increasing release frequency by 40% while maintaining deployment consistency.
- Collaborated with product owners, QA engineers, and enterprise architects in Agile sprints to translate compliance and business requirements into scalable full stack solutions, reducing post-release production defects and improving delivery predictability.

Software Engineer

Jun 2019 - May 2021

Best Buy | Richfield, MN

- Designed and implemented Spring Boot services for order orchestration and inventory validation using Spring Data JPA, increasing checkout completion rates by 18% during peak holiday traffic.
- Partnered with UX designers and product managers to build ReactJS and Angular components integrated with REST APIs, reducing frontend production defects by 20% and improving cart-to-purchase flow.
- Improved product discovery by introducing GraphQL endpoints alongside existing REST services, decreasing page load times by 25% during major promotional events.
- Refactored legacy Java modules into Spring Cloud microservices behind an API Gateway, reducing deployment downtime by 30% and enabling independent service scaling.
- Collaborated with inventory and supply chain teams to implement Kafka-based event streaming for catalog and order synchronization, improving cross-channel stock accuracy and reducing overselling incidents.
- Secured customer-facing APIs using Spring Security with JWT-based RBAC controls, protecting payment and account data in alignment with internal security standards.
- Automated build and release workflows using Maven and Jenkins for Dockerized deployments, lowering rollback incidents by 35% and improving release reliability.
- Analyzed production logs and optimized PostgreSQL queries and Hibernate mappings to resolve recurring system issues, reducing critical incident recurrence by 28% and stabilizing platform performance.

PROJECTS

Cloud-Native Healthcare Interoperability Platform

- Designed a canonical FHIR resource mapping layer using Spring Boot and Spring WebFlux to transform heterogeneous clinical data formats into standardized FHIR R4 structures, enabling consistent interoperability across multi-provider systems.
- Configured Kafka topics with partition strategies and consumer groups to handle high-volume clinical event ingestion, improving downstream processing reliability and preventing message loss during concurrent updates.
- Established Azure-based deployment architecture with Docker containers, automated GitHub Actions pipelines, and environment-specific configuration management, enabling repeatable releases across development and production environments.

Event-Driven Digital Banking Platform

- Architected distributed transaction workflows using Spring Cloud components and API Gateway routing to separate payment authorization, settlement, and reconciliation services for better fault isolation.
- Implemented idempotent Kafka consumers with transactional guarantees to ensure accurate financial record processing, preventing duplicate settlement entries during retry scenarios.
- Designed optimized PostgreSQL schemas with indexing strategies aligned to high-frequency account lookups, improving consistency and throughput for concurrent digital banking users.

Retail E-Commerce Microservices Modernization

- Modeled domain-specific microservices for catalog, cart, and order domains using Spring Boot and REST principles, reducing tight coupling and enabling independent service scaling during demand surges.
- Developed a ReactJS state management strategy using Redux to manage complex cart and checkout flows, improving UI consistency across multiple product categories.
- Introduced Redis-based distributed caching for product metadata and pricing rules, stabilizing response times under heavy promotional traffic while maintaining real-time data synchronization through Kafka events.

EDUCATION

Masters in Computer & Information Systems

Saint Louis University | St. Louis, MO

CERTIFICATION

- AZ-204: Developing Solutions for Microsoft Azure
- Java Programming and Software Engineering Fundamentals Specialization - **Coursera**
- Spring Framework 6 and Spring Boot 3 Specialization - **Coursera**
- AWS Cloud Technical Essentials - **Coursera**
- Docker and Kubernetes Essential Training - **LinkedIn Learning**
